

Basketweaver — User Manual

Version 2.2.0-beta.1

Basketweaver is a real-time timing overlay for EverQuest weapon-weaving. It draws a scrolling highway showing when to swap to your offhand weapon set so your offhand round lands without clipping your mainhand swing timer.

Combat events can be read two ways: from your **EQ log file** (default), or in **Hybrid mode**, which combines the log file with a **Zeal named pipe** if you are running the Zeal client plugin. Both modes produce identical overlays — the difference is only in how data reaches Basketweaver.

1. How It Works

The Weaving Technique

The weaving technique is viable for any class that has dual wield and access to strong 2H weapons. The objective is to get a free "bonus" swing with an offhand weapon in between 2H weapon swings. This works because dual wield runs on an independent timer from your mainhand, and your primary weapon swing timer is not reset when you swap weapon sets.

Done well, weaving has the potential to add approximately 20–30 DPS to a raid target over standard 2H weapon DPS.

The challenge is timing: if you do not swap your weapon set back to your 2H setup before the mainhand timer resets, you will clip your attack — or swing a 1H weapon instead of your high-impact 2H weapon. This is called a **clip**, and it costs more DPS than not weaving at all.

Basketweaver was designed with monks in mind but with additional development can scale to other classes.

What Basketweaver Does

Basketweaver watches every mainhand crush in real time and calculates exactly when your next swing will fire. It draws a scrolling **highway** overlay on top of EverQuest with a **green weave window** that shows the safe zone for your weapon swap. The window approaches a fixed **hit zone** at the left of the highway — when the window reaches the hit zone, swap to your offhand weapon set.

Every event is timestamped at the moment it arrives in the app, not when it was written to disk, which keeps the overlay accurate even during log-flush delays.

The Tracking Pipeline

Interval Measurement & Auto-Calibration

Basketweaver does not rely solely on your configured weapon delay. After each mainhand crush, it measures the actual elapsed time since the previous crush and maintains a rolling median of the last 6 measurements. When the measured median drifts more than 50 ms from the current interval, the overlay silently adjusts and shows a brief **Auto-calibrated** banner.

Calibration samples are filtered: any gap larger than 130% of the unhasted weapon delay is discarded as a skipped swing (out of range, interrupted, etc.) and does not pollute the median.

Grading

At the end of each fight, Basketweaver grades your performance based on the fraction of mainhand rounds in which you made a fist weave attempt. By default grading uses log-detected fist events. If you prefer to grade by keystrokes (so proc failures and dual-wield misses do not penalise you), enable **Keystroke Grading** in Settings.

Grade	Rounds weaved
S	≥ 95%
A	≥ 85%
B	≥ 75%
C	≥ 60%
D	≥ 45%
F	< 45%

2. Core Concepts & Definitions

Swing timer Each weapon in EQ operates on an independent internal countdown. When auto-attack is on, the timer counts down and fires the weapon, then resets to the weapon's delay and counts down again. The timer only runs while auto-attack is active and you have a valid target in range.

Weapon delay EQ stores weapon delays in tenths of a second (e.g. delay 20 = 2.0 s). Basketweaver uses this value as the baseline for interval calculations. Set it via tray → **Mainhand Delay** or the Settings window.

Haste A percentage bonus that shortens effective weapon delays. At 40% haste, a 2.0 s weapon fires every $2.0 / 1.40 = 1.43$ s. The EQ client cap is **125% haste**, giving a minimum effective delay of $\text{base} / 2.25$. Basketweaver tracks your haste via `/mystats` output and adjusts the highway speed accordingly.

Mainhand interval The time between consecutive mainhand swings at your current haste level:

$$\text{interval} = \text{base_delay_seconds} / (1 + \text{haste_pct} / 100)$$

Example: 2.0 s staff at 60% haste → $2.0 / 1.60 = 1.25$ s interval.

Offhand / fist weapon delay The delay of your secondary (fist) weapon, also haste-adjusted. This determines how long the fist timer needs to count down before firing. A shorter fist delay means a narrower safe weave window. Set via tray → **Offhand Delay** or Settings.

Weave window The safe period between mainhand swings during which the fist weapon can fire without delaying the next mainhand. Duration:

$$\text{window} = \text{mainhand_interval} - \text{fist_delay_seconds}$$

Example: 1.25 s interval, 0.71 s fist delay → $1.25 - 0.71 = 0.54$ s window. This is drawn as the **green box** on the highway. A shorter window means tighter timing is required.

Clip A clip occurs when you initiate a fist weave too late — after the mainhand timer has already reset for its next swing. Your fist timer fires into the mainhand window, resetting the mainhand timer and delaying the next crush. Basketweaver flags clips with a red flash, an error sound, and a **CLIPPED** banner. Clipping is worse than skipping a weave because it actively delays mainhand damage.

Hit zone The vertical bar on the left side of the highway that acts as the timing target. Weave actions are judged at this point. When the green window reaches the hit zone, swap to your offhand weapon set. The hit zone position can be moved left or right via Settings → **Target Position** (cosmetic only — timing is not affected).

Target offset A timing correction applied to the hit zone, in milliseconds. A positive offset makes the window appear to arrive at the hit zone slightly later, giving you more reaction time. Adjust if you consistently feel the window is arriving too early.

Latency compensation Fist attack events (punches) that arrive in the log or pipe after a network delay would be scored against the wrong window position. Latency compensation shifts the scoring timestamp backward by the configured amount so the hit is judged at the correct point on the highway. Typical values: 25–75 ms.

Round A complete mainhand swing cycle — from one crush (or miss) to the next. Basketweaver clusters rapid successive mainhand events within a 500 ms window into the same round to handle dual-wield proc firings.

Reaction time The delay between your mainhand crush landing and your first fist attempt in that round. Shown as **avg reaction** on the grade screen. Lower is better — ideally under 200 ms.

Out of range (OOR) When you are too far from your target to swing, EQ blocks the attack. Basketweaver detects OOR messages, plays a brief two-tone alert, and pauses the swing timer prediction (since the mainhand timer is frozen while OOR).

Cursor blocked EQ refuses weapon swaps when you are holding an item on your cursor. Basketweaver detects this and shows a **CURSOR!** banner so you know to clear your cursor before the next weave window.

Keystroke grading An alternate grading mode that counts space-bar or mouse-click presses that land inside a weave window instead of counting log-detected fist events. Useful when your fist attack has a proc component that sometimes fails silently, which would otherwise count as a missed weave under log-based grading.

3. First-Time Setup

Launch

Double-click **Basketweaver** from the Start Menu or desktop shortcut. On first launch a file picker will open automatically.

Select Your Log File

Navigate to your EverQuest folder and select your character's log file:

```
C:\TAKP\TAKPv22\eqlog_YourName_server.txt
```

Make sure EverQuest has logging enabled. In-game command: `/Log on`

Basketweaver remembers your log file and window position between sessions. Your character name is read from the log filename and displayed in the header. If the overlay ever ends up off-screen, use tray → **Reset Window Position** to snap it back to the center of your primary monitor.

Open Settings

Right-click the tray icon → **Settings...** to open the Settings window. All major configuration options live here. See [Section 8](#) for a full reference.

Set Your Mainhand Weapon

In Settings → **Weapon & Timing** → **Mainhand Weapon**, type to search your weapon by name and select it from the dropdown. Alternatively, use tray → **Mainhand Delay** to pick from the full preset list.

Weapon	Delay
Imbued Fighters Staff	4.0s
Norge`tal	4.5s
Ton Po's Bo Stick of Understanding	4.0s
Twisted Steel Bastard Sword	4.5s
Bo Staff of Trorsmang	3.5s
Abashi's Rod of Disempowerment	3.0s
Aggression	4.0s

Bloodied Berserker's Blade	4.0s
Caen's Bo Staff of Fury	3.0s
Emaciated Maul of the Overseer	4.5s
Facesmasher	4.2s
Feartouched Greatsword	4.0s
Gaudralek, Sword of the Sky	3.8s
Greatsword of the Disciple	4.0s
Meljeldin, Bane of Giants	3.8s
Palladius' Axe of Slaughter	4.2s
Rocksmasher	4.1s
Scalecracker	4.3s
Scythe of Shadows	4.0s
Shovel of the Harvest	4.3s
The Sword of Ssraeshza	4.2s
Tranquil Staff	3.0s

Set Your Offhand (Fist) Weapon Delay

In Settings → **Weapon & Timing** → **Offhand Weapon**, search and select your fist weapon. Default is 1.6s (delay 16 — standard monk fists). Alternatively, use tray → **Offhand Delay** to set by delay value.

Tip: Use the `/mystats` calibration macro to auto-detect haste. See [Section 7](#).

4. Hybrid Tracking (Zeal + Log)

Zeal is a client plugin for EverQuest (TAKP / Project Quarm and similar servers) that exposes real-time game data through Windows named pipes. In **Hybrid mode**, Basketweaver reads combat data from both the Zeal named pipe and the log file simultaneously, combining them for the lowest possible latency.

Why Use Hybrid Instead of Log Only?

	Log File	Hybrid (Zeal + Log)
Latency	Bounded by how often EQ flushes the log to disk	Near-instant from Zeal; log fills in anything Zeal misses
Setup	Requires logging on (/log on)	Log still recommended for fallback
Auto-connects to Zeal	No	Yes — detects EQ automatically

Multiple EQ sessions	One log file at a time	Connects to all running EQ processes
-----------------------------	------------------------	--------------------------------------

Requirements

- The **Zeal plugin** must be installed and loaded in EverQuest. Zeal creates a named pipe (`\\.\pipe\zeal_<PID>`) for each running EQ process automatically — no extra configuration is needed.
- Basketweaver and EverQuest must be running on the same machine.

Enabling Hybrid Tracking

Open **Settings...** → **Tracking Source** → select **Hybrid (Zeal + Log)**.

Basketweaver immediately begins scanning for `eqgame.exe` processes every 2 seconds. Once it finds one, it connects to the Zeal pipe and starts receiving events alongside the log file. A log entry appears in the console confirming the connection:

```
[ZealReader] Connected to pipe for PID 12345
```

The overlay behaves identically to log-only mode — swing detection, haste sync, weapon detection, and `/mystats` calibration all work the same way because the text content from Zeal is the same combat text that appears in your log file.

Switching Back to Log Tracking

Open **Settings...** → **Tracking Source** → select **Log File**.

If you had a log file selected before switching to Hybrid, Basketweaver resumes tailing it automatically. If not, it will wait for you to select one via tray → **Select Log File....**

How It Works (technical)

Zeal writes JSON messages to its named pipe in the format:

```
{"type": 0, "character": "Yourname", "data": "{\"type\": 265, \"text\": \"You crush a goblin for 42 points of damage.\"}"}
```

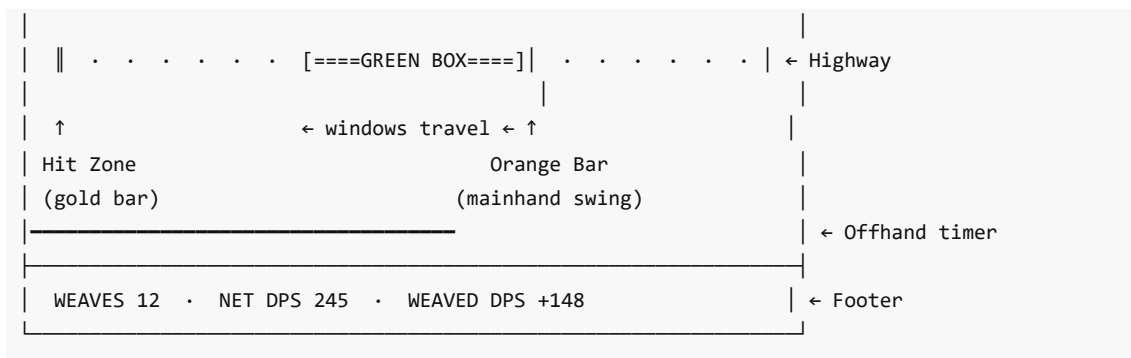

The outer `type` field is the message category (`0` = log text). Basketweaver only processes log text messages. The inner `text` field is the combat line — identical to what would be written to your log file, but without the timestamp prefix.

In Hybrid mode, events from both sources are deduplicated by content so a combat line seen on both the pipe and the log file is only processed once.

5. Understanding the Overlay

The overlay is a scrolling "highway" that sits on top of EverQuest. Weave windows approach from the right and travel left toward the hit zone. Two visual styles are available via Settings → **Overlay Style: Refined** (default) and **High Contrast**.

Taydar	[COMBAT]	2.00s	100%	← Header
--------	----------	-------	------	----------

Elements

|| **Hit Zone** (gold vertical bar, left side) This is your timing target. Weave actions are judged here.

[==GREEN BOX==] (green rectangle) The safe weave window. When **Dynamic Weaving** is enabled (default), the window is divided into zones:

- **Blue wait zone** — the offhand weapon is still on cooldown from your last weave; weaving now would queue too early.
- **Green safe zone** — offhand weapon is ready and you still have time to swing before the next mainhand fires. **Swap here.**
- **Red discouraged zone** — you can still get the swing off but you are cutting it close; missing the green zone is not ideal.

When Dynamic Weaving is disabled the window reverts to a single solid bar (legacy behaviour).

| **Orange Bar** (thin vertical line at left edge of green box) Marks the exact moment your mainhand will swing next. When the orange bar reaches the hit zone, your mainhand fires. Do **not** initiate a weave after this point — you won't have time before the next swing.

—— **Offhand Swing Timer** (thin bar at the bottom of the highway) A progress bar that shows how long until your offhand weapon is ready to fire again. It shrinks from full width toward zero as the cooldown counts down. Colour shifts from **blue** → **cyan** → **bright cyan** as the weapon approaches ready. Toggleable via Settings → **Offhand Swing Timer**.

CURSOR! warning If you try to swap weapons while holding an item on your cursor, EQ will block the swap. Basketweaver detects this, shows a **CURSOR!** banner, and plays an error sound so you know to clear your cursor immediately.

Footer Stats

Stat	Description
WEAVES	Number of mainhand rounds where a fist weave was attempted
NET DPS	Total melee DPS for the fight (mainhand + fist + procs)
WEAVED DPS	DPS contributed specifically by fist weave attacks

Overlay Styles

Two visual styles are available via Settings → **Overlay Style**:

Style	Description
Refined (default)	Dark arcade look — gold bar hit zone, green weave windows, subtle grid
High Contrast	Black background, vivid yellow/cyan colors — good for streaming or low-vision use

6. Timing Your Weaves

The Core Loop

Time flows this way →→→→→→→→

Windows scroll this way ←←←←

PAST	Hit Zone	Highway	FUTURE
------	----------	---------	--------

Step 1: Green box approaching hit zone

. . . || [===GREEN===] |

Step 2: GREEN BOX IS AT HIT ZONE — SWAP TO OFFHAND WEAPON SET NOW ✓

. . . [=||=====] |

Step 3: Orange bar arrives — mainhand swings, window closes

. || . . . [===GREEN===] | . .

What Good Timing Looks Like

When your fist punch lands inside the green window, the hit zone flashes gold and you hear the punch sound.

What a Miss Looks Like

If the weave window passes without a fist attack, a small "— missed" chip appears near the hit zone and fades out.

What a Clip Looks Like

If your fist attack lands outside the weave window (you swung through a window you already passed), a **red wash** floods the highway, the hit zone strobes red, and **CLIPPED** appears in red text. A harsh error sound plays. This means your offhand fired at the wrong time and may have clipped your mainhand swing timer.

End-of-Fight Grade Screen

The grade screen fires when your target dies or when you die. It shows your performance for that fight:

S	18/21 rounds weaved	← Grade + rounds with a weave
	net 312 dps	← Total melee DPS
	+148 dps from weaving	← Added DPS from fist weaves
	142 ms avg reaction	← Crush → fist delay, per round

- **Grade** is based on what fraction of mainhand rounds had a fist weave attempt.

- **Net DPS** is your total melee damage output divided by fight duration.
- **+N dps from weaving** is the DPS contribution from fist attacks alone.
- **Avg reaction** is the average time from your mainhand crush to the first fist attack in that round — measured per round, one sample per round.

Press **Space** to dismiss.

Fight History

Fight results are tracked across all overlay styles and sent to the tray. Open tray → **Recent Fights** to view the last 5 results. The menu entry shows a compact summary; clicking it copies a full detailed line to the clipboard — useful for sharing parse results in Discord or guild chat.

All fight records are also stored locally and visible in the [Leaderboard window](#).

7. Calibration

Automatic Haste Sync

Basketweaver watches for haste information in your log. When your server reports your haste percentage (via `/mystats` or a spell landing), it automatically recalculates the interval and adjusts the highway speed.

After a haste sync you will see a banner:

Haste sync: 1.25s (60% haste)

No manual action needed.

Manual Interval Adjustment

If auto-sync hasn't fired yet (e.g. at the start of a session), you can set the interval manually:

Open Settings → **Weapon & Timing** → **Mainhand Swing Interval**, or use the arrow keys while the overlay is focused:

-  — increase interval by 0.25s
-  — decrease interval by 0.25s

If Weaves Feel Early (green box arrives too soon)

Increase **Target Offset** (shifts the hit zone timing later):

Settings → **Weapon & Timing** → **Target Offset** → try 25 ms, 50 ms steps.

If Weaves Feel Late (you're always catching the tail of the green box)

Decrease Target Offset back toward 0, or adjust **Latency Comp.** if your network adds delay between when you act and when EQ registers it:

Settings → **Weapon & Timing** → **Latency Comp.** → try 25–75 ms.

Calibration Quick Reference

Symptom	Fix
Green box arrives too early, weaves clip	Increase Latency Comp.

Green box arrives too late, mainhand delays	Decrease Latency Comp.
Notes never reach hit zone	Check your log file is updating (logging on?)
Windows don't appear	Enter combat — windows only show during active fighting
Interval wrong after buff / zone	Use ↑ / ↓ keys or set Interval in Settings

8. Settings Window

Open via tray → **Settings....** Changes take effect immediately; click **Save & Close** to persist them across sessions.

Audio Volumes

Setting	Description
Master Volume	Global volume multiplier for all sounds (0–100%)
Buff / Proc Sounds	Volume for Avatar, Savagery, and other buff sounds
Epic / Huge Round	Volume for the epic crit and huge-round sounds
Sound Debounce (ms)	Minimum milliseconds between repeated sounds of the same type. Use 50–150 ms in Hybrid mode to prevent double-firing. Set 0 to disable.

Sound Triggers

Setting	Description
Crit Damage	Minimum single-hit damage to trigger the epic.wav sound
Huge Round	Minimum round total damage to trigger the oh_snap.wav sound

Tracking Source

Option	Description
Log File (default)	Basketweaver tails your EQ log file
Hybrid (Zeal + Log)	Combines Zeal named pipe with log file; lower latency

See [Section 4](#) for full Hybrid mode details.

Overlay Style

Option	Description
Refined (default)	Dark arcade look — gold hit zone, green weave windows, subtle grid
High Contrast	Black background, vivid yellow/cyan — good for streaming or low-vision

Changing the style reloads the renderer. Your log file reconnects automatically and all persisted settings are restored.

Weapon & Timing

Setting	Description
Mainhand Weapon	Search and select your 2H weapon; sets the base delay
Offhand Weapon	Search and select your fist/offhand weapon; sets offhand delay
Mainhand Swing Interval	Override the post-haste swing interval manually
Target Offset	Fine-tune hit zone timing in ms (positive = later)
Latency Comp.	Compensate for network/input delay in ms
Clip Window	Duration after a weave to suppress duplicate detections
Weave Window (ms, 0=auto)	Override the weave window width. 0 = auto-derived from interval minus offhand delay

Custom weapon delays can be entered in EQ tenths-of-seconds (e.g. 28 = 2.8 s) using the custom field that appears when no preset matches your search.

Display

Setting	Description
Target Position	Move the hit zone left or right (cosmetic; timing unaffected)
Opacity	Overlay transparency (50–100%)

Options

Option	Description
Audio Enabled	Master toggle for all sounds
Buff Sound Enabled	Play sounds when Avatar, Savagery, or Innerflame is detected
Fist Sound on Miss	Play a whiff sound when a fist weave misses
Dynamic Weaving	Show color-coded weave window zones (blue/green/red) based on offhand cooldown
Offhand Swing Timer	Show a thin bar at the bottom of the highway indicating offhand weapon readiness
Keystroke Grading	Grade weaves by keystrokes rather than log-detected fist attacks
Offhand Same Attack Type (timing)	Treat a second crush in a round as the offhand event (for blunt offhand weapons like Ribcracker)
Freeze Window Position	Lock the overlay in place so it cannot be dragged
Show All Crits on Track	Display all critical hit banners on the highway, not just those above the epic threshold

Positive Feedback Audio in Weave Windows	Play the punch sound on any in-window attempt; play the whiff sound only for out-of-window swings
Weave Off Delay (ms)	How long to keep the weave state active after a swap-back bandolier message is detected (Zeal pipe may arrive before the hit)

Leaderboard

Configure the community leaderboard upload feature. See [Section 10](#).

Setting	Description
Character Name	Your character name for leaderboard records (auto-detected from log or Zeal)
Vercel URL	URL of the community leaderboard API (e.g. <code>https://basketweaver.vercel.app</code>)
API Key	Shared secret required for POST authentication
Upload records to community leaderboard	Enable automatic upload of fight records after each fight

9. Tray Menu Reference

Right-click the Basketweaver icon in the system tray to open the menu.

Option	Description
Settings...	Open the Settings window
Status	Shows IN COMBAT or IDLE (read-only)
Select Log File...	Choose a different EQ log file
Reset Track	Hard reset — clears all state if overlay gets out of sync
Clear Buffs (AVT/SAV)	Manually clear tracked Avatar and Savagery buff states
Buff Notification Sounds	Toggle buff detection sounds on / off
Reset Window Position	Snap overlay to a safe central position on the primary monitor
Freeze Window Position	Lock the overlay window so it cannot be dragged
Recent Fights	Last 5 fight results; click any entry to copy full stats to clipboard
Top Crits	Your top critical hits this session (mob name, damage, date)
Top Huge Rounds	Your top huge-round totals this session (mob name, damage, date)
Mainhand Delay	Select your mainhand weapon from the full preset list
Offhand Delay	Set your fist weapon delay by value

Audio	Toggle all sounds on / off
Leaderboard...	Open the Leaderboard window
Basketweaver vX.X.X	Current version (read-only)
Quit Basketweaver	Exit the app

10. Leaderboard

The Leaderboard window stores and displays your fight records locally, and optionally uploads them to a shared community board.

Opening the Leaderboard

Right-click the tray icon → **Leaderboard...**

What It Shows

Each row in the table represents one completed fight and includes:

Column	Description
Mob	Name of the target you killed
Grade	Weave grade for that fight (S / A / B / C / D / F)
Total DPS	All melee DPS (mainhand + fist + procs)
Added DPS	DPS contributed by fist weave attacks alone
Mainhand	Detected mainhand weapon name
Offhand	Offhand weapon from config
ATK	Your ATK rating at the time of the fight
Haste	Your haste percentage at the time of the fight
Disciplines	Disciplines activated during the fight (e.g. Innerflame 45%)
Bufs	Bufs active during the fight (e.g. Avatar 100%, Savagery 60%)
Engaged	Time actually in melee range
Duration	Total wall-clock fight length
Rounds	Total mainhand rounds
Weave %	Percentage of rounds where a weave attempt was made
Character	Your character name
Date	Date and time the fight ended

Filtering and Sorting

Use the **Mob** and **Character** filter boxes at the top to narrow results. Click any column header to sort by that column; click again to reverse the order.

DPS Chart

Click any row to open a time-averaged DPS chart for that fight. The chart shows per-second DPS (normalized over a 15-second window for the first 15 seconds to remove the initial spike), a peak DPS marker, and a grid with 15-second intervals. Click **Close Chart** to dismiss.

Uploading to the Community Board

Individual records can be uploaded by clicking the **Upload** button in each row. To upload all visible (filtered) records at once, click **Upload All**.

Once sent, the button changes to ✓ **Sent**.

To configure upload credentials, open **Settings...** → **Leaderboard** section and enter your Vercel URL and API Key. Check **Upload records to community leaderboard** to upload automatically after each fight.

A **View Community Board** ↗ link appears in the leaderboard window once a Vercel URL is configured.

Note: Records are stored locally in `%APPDATA%\Basketweaver\Leaderboard.json`. Up to 100 records per mob name are kept, ranked by total DPS. History persists between sessions.

11. Keyboard Shortcuts

These work when the Basketweaver window is in focus (click it once).

Key	Action
↑ / ↓	Interval +0.25s / -0.25s
H	Toggle orientation (horizontal ↔ vertical)
R	Reset track (same as tray Reset Track)
M	Toggle audio mute
Space	Dismiss grade screen
Escape	Quit

12. Troubleshooting

Overlay doesn't show weave windows Weave windows only appear once you enter combat. Make sure logging is enabled (`/log on`) and the correct log file is selected. The header shows IDLE when no combat is detected.

Interval seems wrong after zoning or getting a haste buff Press `↑` or `↓` to nudge the interval, or run `/mystats` to let Basketweaver re-sync automatically.

Weaves land but are consistently late/early by the same amount Use **Target Offset** or **Latency Comp.** in Settings. Start with 25 ms steps and adjust until the hit zone flashes gold reliably at the moment you click swap.

The track gets out of sync mid-fight Press `R` or use tray → **Reset Track** to hard-reset the engine without closing the app.

Grade screen doesn't appear after a kill The grade screen fires when your current target dies — either `You have slain TARGET` or `TARGET has been slain by X` — provided you attacked that target within the last 10 seconds. It also fires when you die. Zone and logout end combat silently with no grade screen.

Out-of-range alert sound keeps playing The two-tone blip plays at most once every 1.5 seconds while you are in combat and out of range. It stops as soon as your mainhand connects again. If it fires outside of combat, check that your `COMBAT_END` patterns match your server's death/zone messages.

Audio not playing Click the overlay window once to focus it, then press `M` to toggle audio. You can also toggle via tray → **Audio** or Settings → **Audio Enabled**.

App asks for a log file every time If the previously saved log file is deleted or moved, the picker will open on launch. Select the new path and it will be remembered. If you use Hybrid mode, a log file is still recommended — switch tracking source in Settings if you prefer log-only mode.

Hybrid mode shows no events from Zeal

- Confirm Zeal is loaded in EverQuest (`/zeal` should respond in-game).
- Both Basketweaver and EQ must be running on the same machine — pipes are local-only.
- Basketweaver scans for `eqgame.exe` every 2 seconds after switching to Hybrid mode. If EQ was started after Basketweaver, wait a moment or use tray → **Reset Track** to nudge the connection attempt.
- If EQ crashes or exits, Basketweaver detects the pipe closing and will reconnect automatically when EQ relaunches.

Switched to Hybrid but weave windows stopped The Zeal plugin must be actively loaded. If you zoned or camped and Zeal unloaded, it will stop sending pipe data. Reload Zeal in-game and Basketweaver will reconnect within 2 seconds. Log-based events continue in the meantime.

Recent Fights submenu always shows "No fights recorded yet" Fight history is recorded after each combat engagement ends (mob death or player death). If it is empty, no fights have completed since the app launched.

Leaderboard shows no records Records are only saved after a fight completes (mob or player death). If you have completed fights and still see nothing, check that `%APPDATA%\Basketweaver\leaderboard.json` exists and is readable.

Upload button does nothing Ensure the Vercel URL and API Key are configured in Settings → **Leaderboard**. Check that your internet connection is available. Upload requests time out after 8 seconds; if the community server is unreachable the button will silently fail.

Basketweaver — designed with monks in mind, built to scale.
